

**Report From G-QRP Club  
For the Spectrum Forum Meeting  
To Be Held 20<sup>th</sup> September 2008**

No new Forum issues arose for the Club during the year. With the continuing poor propagation conditions on the HF bands, and therefore a lower level of activity amongst the Club's members, there has been a reduction in comments received expressing concern over 'intrusion' by data mode operators into the CW section of the bands. As the QRP calling frequencies tend to be near the top end of each CW allocation they are particularly vulnerable to such QRM. I suspect the quantity (and volume) of comments may well increase in direct proportion to any improvement in band conditions.
